Discussion:

Awaiting mixed phase or cold rain event to hit tonight (05/02 UTC time). Seems likely it will be later into the night or even the morning hours.

NPOL and D3R running nominally. More blockage noted in 0.5 tilt so we are testing 0.7 tilt as lowest angle in NPOL scans (could also just be more refractive effects as colder air came in....). Dave has images ready to go for export to internet/portal. Joe Hardin worked out the VPN situation in NPOL Science container and now remote access to D3R (and even to NPOL) is possible.

Gauges/2DVD's were up and communicating. Network in good shape as near as we can tell.

Witek reported that the first X-band was deployed and collected data on north side of Turkey in rain of 4/30. Next deployment planned for tomorrow (5/02).
